The OseneY Abbey flock

By DAVID POSTLES

SUMMARY

Sheepfarming was an important aspect of demesne agriculture in the middle ages, as wool was an important commodity. The flock policy of OseneY Abbey changed from a 'manorial' to an 'intermanorial' organisation of the sheep. Whereas the demesne arable contracted significantly during the later middle ages, flock husbandry was maintained at a significant level. These aspects are described as well as the difficult sources allow, and the main source, the account of the prepositus bidencium for 1476/7, is edited.

Flock management policies on seignorial estates altered radically during the late middle ages. On many estates, both lay and religious, a policy of centralisation gradually replaced the initial local management of the flock. Furthermore, at the same time as arable demesnes were being leased out to firmarii, some lords were investing on a greater scale in pastoral husbandry, particularly developing their flocks. Whilst seignorial arable production thus declined, interest in sheep and wool production was not abated. The more efficient exploitation of wool growing led to centralisation of flock management.1 The whole effort, of course, was probably directed towards the buoyant export market for English woollen cloth.2 The changes of management adopted by OseneY Abbey epitomise this general movement. A central flock account is also extant for 1476–7, and is edited below.3

In the late 13th century, the flocks of OseneY Abbey were managed locally. Each property of the Abbey, where there was a flock, had its own shepherd responsible to the reeve or bailiff, depending on the type of property.4 The reeve accounted for the flock and the clip. An incomplete centrally-enrolled account of most of the properties of the Abbey c. 1280 discloses 2818 sheep, so the total complement of the manorial flocks in the late 13th century may have been more than 3000 animals (Table IV). Forest Hill and Waterperry are wanting from this central account, but manorial accounts for these two properties at the time reveal some two hundred sheep at each. The prominence of Water Eaton appears from the sheep statistics. In c. 1280, Water Eaton supported some 20 per cent of the total flocks:

4 A reeve was normally a customary tenant, a bailiff a freeman. On the OseneY estate (which in this respect is somewhat different from others, for instance Merton College's) there would be a bailiff only on glebe-demesnes, where there were no customary tenants, and a reeve on 'manorial' properties where there were unfree tenants.
633 sheep of a total exceeding 3000. Water Eaton probably also emerged as the central point for the collection of fleeces from all properties at this time. Although the *proficium* calculation in the central account refers to fleeces despatched to Osency, the extant manorial accounts reveal that the fleeces were actually sent to Water Eaton. The entries in the *proficium* calculation are probably a fictitious arrangement in this respect. The fleeces may have been nominally counted as liveries to the house with an artificial value placed on them.

In the 14th century, Water Eaton definitely became the central collecting-point for fleeces. It may have been selected because of its convenient position. In the configuration of the Osency estates it was as central as possible; wool could be conveniently carried overland to Watlington and then on to Henley for transport by water. Much of the clip may have been destined for Italian merchants. Pegolotti's list includes Oseney for 25 sacks for export; this figure may be an underestimate, as the list is concerned only with the Italian export trade. Oseney certainly came into frequent contact with Italian merchants through acting as a sub-collector for Papal and royal taxation.

In the early 14th century, the manorial flocks suffered some vicissitudes. The flock at Forest Hill declined seriously; the flock at Waterperry disappears from view altogether; the flock at Stone collapsed. For example, whereas Stone supported 391 sheep in c. 1280, only eleven sheep remained at Michaelmas 1325. At Forest Hill, the flock in 1302–4 comprised less than half the number in c. 1280, and seems to have disappeared completely in 1317–18. A critical decision seems then to have been taken to restock these properties: Forest Hill c. 1321–2; Stone in 1326–7; Waterperry in 1329–30. Hitherto, Watlington had not retained its lambs which were received from tithe. In 1342, however, the Abbey decided to maintain a flock there. The restocking of Waterperry anticipated the future road to specialisation, as the flock consisted mostly of wethers. After restocking, Stone supported between 213 and 317 sheep. Waterperry 125–230 and Watlington about 70 (figures at year-end).

The final transition to a fully centralised method of flock management must have occurred during the 15th century. Unfortunately, the fragmentary survival of the manorial accounts allows no more precision. During the 14th century, the management continued to be local: reeve and shepherd. Signs of central direction, which there must have been at all times, became more emphatic: Water Eaton firmly became the central collection point for fleeces; some manors specialised in wool production, carrying only wethers; decisions were made to reconstitute the flocks where they had become depleted. Suddenly, the flock account of 1476–7 confronts us.

This account presented by Robert Howse, *prepositus bidencium*, reflects the apogee of central direction of the Abbey's flocks. During the course of the late 14th and 15th centuries, the Abbey had embarked on the policy of leasing its arable demesnes to *firmarii*, apart from home farms at the properties nearest to the Abbey. Simultaneously, the Abbey decided to retain its flocks at selected properties and to concentrate its farming activities on sheep farming. The retreat from agriculture by the Abbey was therefore not comprehensive, but selective. The entire flock of the Abbey became entrusted to a head shepherd, Robert Howse, who controlled a team of (under-) shepherds. This alteration of policy

 accorded well with the precepts of contemporary treatises, such as the *Modo qualiter Clericus siue Expensor* with its specimen account of the *Instaurato ridicium*. This advice contrasts strongly with the 13th-century treatises, which allowed the local management of reeve and shepherd. Parallel developments took place on other estates. The account reflects not only a centralisation of control, but also a high degree of specialisation, with different objectives at the properties.

The breakdown of the statistics of sheep remaining at the end of the accounting year (Table I) confirms the specialisation which was part of the centralising policy. Four places were specifically breeding or reproduction centres, where there were only ewes with rams to service them. At Water Eaton the very high number of hoggs can be assumed to be for restocking the ewes. Cowley, Arlington, Water Eaton and Weston were all reproduction centres. By contrast, five other places (Bibury, Black Bourton, Fulwell, Hook Norton and Hampton Gay) had only wethers. These properties probably concentrated on wool production. The precise status of Walton in this arrangement is confusing.

The arrangement is also reflected in the organisation of the shepherds. Howse was the head of the team. Under him, there were shepherds at Arlington, Weston, Cowley, Water Eaton, Bibury and Walton. The first four of these places (Arlington, Weston, Cowley and Water Eaton) were the reproduction centres. It was obviously felt to be important to have shepherds on the spot in the breeding places, for these accounted for five of the seven shepherds under Howse. Water Eaton had two shepherds, one for the ewes and one for the hoggs, which may further emphasise the central position of Water Eaton in the organisation of the flocks. It had developed as the central collecting point for fleeces of the Abbey's estates, and it now also acted as the main reproduction centre. The number of ewes and hoggs far exceeded the numbers at other places. Indeed, it supported twice as many sheep as any other property, and its flock comprised more than a quarter of the total flock of the

Robert Howse – centre

Abbey. The other two shepherds were attached to Walton and Bibury. The existence of a shepherd at Walton could suggest that this property was also a breeding centre; the ewes may have been depleted in the recent years, and the hoggs intended to restock the ewes. The shepherd at Bibury may have been despatched there because Bibury is an outlying property in Gloucestershire. Bibury is unusual in that it was the only wool property, supporting only wethers, to have a shepherd on the spot. The other properties with flocks exclusively of wethers (Black Bourton, Fulwell, Hook Norton and Hampton Gay), apparently did not have a resident shepherd. Howse himself was probably responsible for these properties. Obviously, the Abbey believed that a shepherd was necessary on the spot where lambs would be dropped. However, someone must have been employed to care for the flocks elsewhere, even if not a specialist shepherd in the continuous employ of Howse.

A surprising feature of the breeding centres is the low number of rams to service the ewes. Trow Smith suggests that the usual ratio was one tup to thirty-five to fifty ewes, although he included examples of poor tupping rates. At Water Eaton, if the account can

Total 2818

be believed, a ram was expected to service eighty ewes; a ram at Arlington would need to contend with 150 ewes, and a ram at Weston would have the slightly less arduous task of acting as sire to 100 ewes. Perhaps rams were hired additionally; otherwise, the ewes at Cowley might have become easily frustrated. The Abbey may have suffered the repercussions of this unenlightened policy, as the issue of lambs was only 658 although 878 ewes remained from the previous year, reinforced by 241 hoggs received during the course of the year (Table III).

The change to pastoral husbandry was achieved by the conversion of arable to pasture in selected properties. In 1517, Oseney was presented to enclosure commissioners for converting 107 acres in Water Eaton in 1508. Recently, Dyer has argued that this sort of activity was not the cause of depopulation, but was a response to structural changes in the agrarian economy. Where Oseney is known to have converted to pasture and engage in sheepfarming in deserted or contracted villages, the depopulation was not uniform. Fulwell had been converted into a grange very soon after its acquisition in 1205. Depopulation at Hampton Gay probably began before 1428, and conforms to Dyer’s concept of structural change. At Water Eaton, although the Abbey converted from tillage to pasture, many tenants remained there throughout the 16th century until total depopulation by Mr. Frere in the late 16th century. The changes in the Abbey’s exploitation of its property may have been a response rather than an initiative.

I am extremely grateful for the very helpful comments of Professor Paul Harvey, Dr. Christopher Dyer, Miss Bronac Holden and the Editor for the improvement of this paper, without committing them to any remaining shortcomings, which are entirely my own.

APPENDIX: THE FLOCK ACCOUNT OF 1476-7.

Notes on the document and editorial conventions.

The account roll of the *prepositus bidencium* is Bodleian Library MS. Oseney Roll 26. It comprises a single membrane, written on the face and dorse. On the face is the cash account, on the dorse the stock account. The account is written in a fair Bastard Secretary hand. At the head of the roll, on the face, the initials of the title are decorated with elaborate strapwork. There is also some strapwork on the word *Summa* as it recurs. There are no cancellations, interlineations or alterations. It is clear that this is an engrossed account. This suspicion is confirmed by the *Stipendia* paragraph, which refers to the wage of the clerk for writing the account and for engrossing the account. The exception to the above is the very end of the account on the dorse, where, almost as an afterthought, there is an account of the fells remaining. The hand of this part seems to be the same as the main account, but this part of the roll is written much more cursively and hurriedly. The hurried nature of this part is reflected in the omission of the figures in the paragraph for *pelles multonum*. The intention here was to give a breakdown of fells remaining on each property, but only the names of the places were entered, not the number of fells.

The account is printed in full below. All words have been extended, except where the extension could be doubtful. The clerk extended some words in some places, but not in others. Throughout, the clerk’s extension has been followed, with a note where the clerk has extended the word. The paragraph headings are given in the upper case to differentiate them from the main body of the text. The headings are not, of course, in the upper case in the original MS. The short hundred (100) not the long hundred (120) was used by the accounting official.

1 MS. *recept*. It could be extended *receptum* or *recepta*, but as there is only one entry, I have extended it in the singular.

2 The central collecting point for fleeces in the fourteenth century.

3 *Ut extra* occurs on the face in the cash account, *ut infra* on the dorse in the stock account. They refer to the other side of the account. The use of *ut infra* to refer from the stock account to the cash account suggests that the stock account was audited first, as was the usual practice with manorial accounts. The reason was that any items to be charged against the accounting official from the stock account could be transferred by the auditors to the cash account.

\(^{20}\) mort' should agree with the type of sheep.

\(^{21}\) MS. sic. Possibly de omitted.

\(^{22}\) Throughout, the word is fully extended, usually as de grege, but sometimes, as here, de gregibus.

\(^{23}\) MS. do'.

\(^{24}\) The short hundred is being used, but the arithmetic is suspect.

\(^{25}\) These two figures are written in above the line.

\(^{26}\) Unextended here, so possibly either grege or gregibus.
CUSTUS FALDE. Et computat sol' pro xi cladibus emptis hoc anno de Johanne Wat' de Stunsfeld27 pro falda domini apud Coveley preci cladis iid. vis. viiid.

Summa vis. viiid.

EXPENSE NECESSARIE.28 Et computat sol' pro i li. de pakkyng tempore tensionis lanarum domini in diversis locis iiiid. Summa DCCCxxxix. De quibus

---

34 MS. coquin; could be coquinam or coquinarium.
35 MS. sic.
36 MS. do.
37 Extended in full here and in all succeeding entries in the MS., but unextended in the MS. as adiunct under the wethers.
38 MS. illegible; the arithmetic, although it cannot be followed precisely, suggests a very high figure. Reference to the face of the roll (Vendicio pellium matricium) may supply the figures. An early repair has made the end of this paragraph very difficult.
39 Figure illegible.
40 MS. greg unextended; see n. 26.
